

# APHANOMYCES SOIL TEST

---

1. Sample across entire field in a W shaped pattern. Choose sample points in landscape depressions, wet areas of a field, or ruts where water may accumulate.
2. Clear loose organic matter from the topsoil.
3. Collect 2 cups of topsoil.
  - A composite sample may be composed by evenly mixing soil taken from each sampling point.
4. Let sample **air dry** before placing in a plastic, resealable bag. A cooler is not required.
5. Ship or Drop Off the soil sample to;  
**507-11 Ave Nisku, Alberta T9E 7N5**

**SEND IN A SAMPLE TODAY**

# APHANOMYCES SOIL TEST

---

- **DO NOT** test a soil sample from fields that have a susceptible host plant and do not sample soil near a host plant. Test infected plants instead.
- A **positive test result** indicates that under the right environmental conditions and in a susceptible host, there is a potential for the disease to occur.
